Triode plate resistance (non-linear example) (*Motion picture*) Animated Electronics Films, 1967.

4 min. si. color. super 8 mm. (Electronic circuit theory series)
Loop film mounted in cartridge.
With narrative guide and animation model.
Summary: Explains that in the nonlinear portions of the plate characteristic curves of a triode tube the grid voltage is held constant and the plate voltage is varied in small increments, causing incremental changes in plate current, and that a series of points result on the plate characteristic curve, which when plotted give a graphical determination of the triode plate resistance.

4 min si. color. super 8 mm. (Electronic circuit theory series)
Loop film mounted in cartridge.
With narrative guide and animation model.
Summary: Presents a typical laboratory experiment which shows by means of animation the movements of all electron currents, and the buildup and decay of significant voltages, which occur while a series of points are measured and plotted on cross-section paper. Points out that these points then lead to a family of curves which are known as the linear transconductance.

4 min. si. color. super 8 mm. (Electronic circuit theory series)
Loop film mounted in cartridge.
With narrative guide and animation model.
Summary: Follows a typical laboratory experiment in which the ratio between small increments of grid voltage, and of plate current, are derived and plotted on cross-section paper on which the families of curves relating grid voltage, plate voltage, and plate current have already been drawn. Shows how the ratio is derived in the nonlinear portion of these curves. With subtitles.
